

Abstract of the Disclosure

A processor (804) locates a position for displaying an image on at least one of first and second display portions (202, 204) of a display (200) including a visible seam (206) between the display portions (202, 204). The processor (804) then cooperates with the display (200) to display the image in the position such that, when the position extends beyond one of the display portions (202, 204) and onto a next one of the display portions (202, 204), a portion of the image corresponding to the location of the visible seam (206) is omitted.
